

The more-than 1.2 million km of fibre-optic cables that criss-cross the planet carry the world's phone calls, internet signals and data. But this summer, researchers published the eerie sounds of blue and ...

Results may help reduce gravity-induced defects in optical glass products developed on Earth and advance in-space manufacturing models. The investigation also opens the door to creating ...

Using a combination of sensing and existing fiber-optic networks, researchers are exploring the detection and monitoring of marine life activities, as well as other aspects of the Earth itself and beyond.

But this summer, researchers published the eerie sounds of blue and fin whales detected by a fiber-optic cable on the west coast of Svalbard--a first. Now the researchers want to eavesdrop on an...

Fiber optic cables don't just carry data from sensors; now, they are the sensors. By offering the equivalent of a seismometer every meter or so along their length, fibers portend a ...

Discover how undersea fiber optic cables form the backbone of the global internet, carrying over 95% of international data. Explore submarine cable technology, DWDM, optical ...

Each undersea cable contains multiple optical fibers, thin strands of glass or plastic that use light signals to carry vast amounts of data over long distances with minimal loss.

Slide 11: At the lower part of the glacier, at ca. 2,500 m elevation, we installed two kinds of instruments: a 1 km long fibre-optic cable in a triangular shape, and three seismometers, one in each ...

Now, researchers are using them to defend against earthquakes and produce an unprecedented map of the underground world. Beneath the winding streets of Istanbul, Turkey, a ...

More than 1.48 million kilometres of underwater fibre-optic cables carry almost all global internet and telephone traffic. Now researchers are showing that these cables can do more than ...

Earth Exploration Optical Cable
